Functional Description

The CY621472E30 is a high performance CMOS static RAM (SRAM) organized as 256K words by 16 bits. This device features advanced circuit design to provide ultra low active current. It is ideal for providing More Battery Life™ (MoBL®) in portable applications such as cellular telephones. The device also has an automatic power down feature that significantly

reduces power consumption when addresses are not toggling. Placing the device into standby mode reduces power consumption by more than 99 percent when deselected (\overline{CE}_1 HIGH or CE_2 LOW or both \overline{BLE} and \overline{BHE} are HIGH). The input and output pins (I/O₀ through I/O₁₅) are placed in a high impedance state when:

- Deselected (\overline{CE}_1 HIGH or CE_2 LOW)
- Outputs are disabled (\overline{OE} HIGH)
- Both Byte High Enable and Byte Low Enable are disabled (\overline{BHE} , \overline{BLE} HIGH)
- Write operation is active (\overline{CE}_1 LOW and CE_2 HIGH and \overline{WE} LOW)

To write to the device, take Chip Enable (\overline{CE}_1 LOW and CE_2 HIGH) and Write Enable (\overline{WE}) inputs LOW. If Byte Low Enable (\overline{BLE}) is LOW, then data from I/O pins (I/O₀ through I/O₇) is written into the location specified on the address pins (A₀ through A₁₇). If Byte High Enable (\overline{BHE}) is LOW, then data from I/O pins (I/O₈ through I/O₁₅) is written into the location specified on the address pins (A₀ through A₁₇).

To read from the device, take Chip Enable (\overline{CE}_1 LOW and CE_2 HIGH) and Output Enable (\overline{OE}) LOW while forcing the Write Enable (\overline{WE}) HIGH. If Byte Low Enable (\overline{BLE}) is LOW, then data from the memory location specified by the address pins appear on I/O₀ to I/O₇. If Byte High Enable (\overline{BHE}) is LOW, then data from memory appears on I/O₈ to I/O₁₅. See the Truth Table on page 11 for a complete description of read and write modes.

Notes

14. Test conditions for all parameters other than tri-state parameters assume signal transition time of 3 ns (1 V/ns) or less, timing reference levels of $V_{CC(typ)}/2$, input pulse levels of 0 to $V_{CC(typ)}$, and output loading of the specified I_{OL}/I_{OH} as shown in the [Figure 2 on page 5](#).
15. At any temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZBE} is less than t_{LZBE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any device.
16. t_{HZOE} , t_{HZCE} , t_{HZBE} , and t_{HZWE} transitions are measured when the outputs enter a high impedance state.
17. If both byte enables are together, this value is 10 ns.
18. The internal write time of the memory is defined by the overlap of \overline{WE} , $\overline{CE} = V_{IL}$, \overline{BHE} , \overline{BLE} , or both = V_{IL} . All signals must be active to initiate a write and any of these signals can terminate a write by going inactive. The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.
19. The minimum write cycle pulse width for WRITE Cycle 4 (\overline{WE} controlled, \overline{OE} LOW) should be equal to the sum of t_{HZWE} and t_{SD} .

Notes

20. The device is continuously selected. $\overline{\text{OE}}$, $\overline{\text{CE}} = V_{\text{IL}}$, $\overline{\text{BHE}}$, $\overline{\text{BLE}}$, or both = V_{IL} .

21. $\overline{\text{WE}}$ is HIGH for read cycle.

22. $\overline{\text{CE}}$ refers to the internal logical combination of $\overline{\text{CE}}_1$ and CE_2 such that when $\overline{\text{CE}}_1$ is LOW and CE_2 is HIGH, $\overline{\text{CE}}$ is LOW. For all other cases $\overline{\text{CE}}$ is HIGH.

Notes

- 24. \overline{CE} refers to the internal logical combination of \overline{CE}_1 and CE_2 such that when \overline{CE}_1 is LOW and CE_2 is HIGH, \overline{CE} is LOW. For all other cases \overline{CE} is HIGH.
- 25. The internal write time of the memory is defined by the overlap of \overline{WE} , $\overline{CE} = V_{IL}$, \overline{BHE} , \overline{BLE} , or both = V_{IL} . All signals must be active to initiate a write and any of these signals can terminate a write by going inactive. The data input setup and hold timing must be referenced to the edge of the signal that terminates the write.
- 26. Data I/O is high impedance if $OE = V_{IH}$.
- 27. If \overline{CE} goes HIGH simultaneously with $WE = V_{IH}$, the output remains in a high impedance state.
- 28. During this period, the I/Os are in output state. Do not apply input signals.

- 31. The minimum write cycle pulse width should be equal to the sum of t_{HZWE} and t_{SD} .
- 32. During this period, the I/Os are in output state. Do not apply input signals.
